Data are often organized into matrices. For example, the National Federation of State High School Associations uses matrices to record student participation in sports by category for males and females. To find the total participation of both groups in each sport, you can add the two matrices. You will learn how to add matrices in Lesson 4-2.

4-1 Introduction to Matrices

What You’ll Learn
- Organize data in matrices.
- Solve equations involving matrices.

How are matrices used to make decisions?
Sabrina wants to buy a sports-utility vehicle (SUV). There are many types of SUVs in many prices and styles. So, Sabrina makes a list of the qualities for different models and organizes the information in a matrix.

When the information is organized in a matrix, it is easy to compare the features of each vehicle.

ORGANIZE DATA A matrix is a rectangular array of variables or constants in horizontal rows and vertical columns, usually enclosed in brackets.

Example 1 Organize Data in a Matrix
Sharon wants to install cable television in her new apartment. There are two cable companies in the area whose prices are listed below. Use a matrix to organize the information. When is each company’s service less expensive?

<table>
<thead>
<tr>
<th>Metro Cable</th>
<th>Cable City</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic Service (26 channels)</td>
<td>$11.95</td>
</tr>
<tr>
<td>Standard Service (53 channels)</td>
<td>$30.75</td>
</tr>
<tr>
<td>Premium Channels (in addition to Standard Service)</td>
<td></td>
</tr>
<tr>
<td>• One Premium</td>
<td>$10.00</td>
</tr>
<tr>
<td>• Two Premiums</td>
<td>$19.00</td>
</tr>
<tr>
<td>• Three Premiums</td>
<td>$25.00</td>
</tr>
</tbody>
</table>

Organize the costs into labeled columns and rows.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Metro Cable</td>
<td>11.95</td>
<td>30.75</td>
<td>40.75</td>
<td>49.75</td>
</tr>
<tr>
<td>Cable City</td>
<td>9.95</td>
<td>31.95</td>
<td>40.90</td>
<td>48.90</td>
</tr>
</tbody>
</table>

Metro Cable has the best price for standard service and standard plus one premium channel. Cable City has the best price for the other categories.
In a matrix, numbers or data are organized so that each position in the matrix has a purpose. Each value in the matrix is called an element. A matrix is usually named using an uppercase letter.

\[
A = \begin{bmatrix}
2 & 6 & 1 \\
7 & 1 & 5 \\
9 & 3 & 0 \\
12 & 15 & 26
\end{bmatrix}
\]

A matrix can be described by its dimensions. A matrix with \( m \) rows and \( n \) columns is an \( m \times n \) matrix (read “\( m \) by \( n \)”). Matrix \( A \) above is a \( 4 \times 3 \) matrix since it has 4 rows and 3 columns.

A matrix can be described by its dimensions. A matrix with \( m \) rows and \( n \) columns is an \( m \times n \) matrix (read “\( m \) by \( n \)”). Matrix \( A \) above is a \( 4 \times 3 \) matrix since it has 4 rows and 3 columns.

Certain matrices have special names. A matrix that has only one row is called a row matrix, while a matrix that has only one column is called a column matrix. A matrix that has the same number of rows and columns is called a square matrix. Another special type of matrix is the zero matrix, in which every element is 0. The zero matrix can have any dimension.

**EQUATIONS INVOLVING MATRICES**

Two matrices are considered equal matrices if they have the same dimensions and if each element of one matrix is equal to the corresponding element of the other matrix.

\[
\begin{bmatrix}
6 & 3 \\
0 & 9 \\
1 & 3
\end{bmatrix} \neq \begin{bmatrix}
6 & 0 & 1 \\
3 & 9 & 3
\end{bmatrix}
\]

The matrices have different dimensions. They are not equal.

\[
\begin{bmatrix}
1 & 2 \\
8 & 5
\end{bmatrix} \neq \begin{bmatrix}
1 & 8 \\
2 & 5
\end{bmatrix}
\]

Corresponding elements are not equal. The matrices are not equal.

\[
\begin{bmatrix}
5 & 6 & 0 \\
0 & 7 & 2 \\
3 & 1 & 4
\end{bmatrix} = \begin{bmatrix}
5 & 6 & 0 \\
0 & 7 & 2 \\
3 & 1 & 4
\end{bmatrix}
\]

The matrices have the same dimensions and the corresponding elements are equal. The matrices are equal.

The definition of equal matrices can be used to find values when elements of equal matrices are algebraic expressions.

**Example 3**

**Solve an Equation Involving Matrices**

Solve \( \begin{bmatrix} y \\ 3x \end{bmatrix} = \begin{bmatrix} 6 - 2x \\ 31 + 4y \end{bmatrix} \) for \( x \) and \( y \).

Since the matrices are equal, the corresponding elements are equal. When you write the sentences to show this equality, two linear equations are formed.

\[ y = 6 - 2x \]
\[ 3x = 31 + 4y \]
This system can be solved using substitution.

\[ 3x = 31 + 4y \quad \text{Second equation} \]
\[ 3x = 31 + 4(6 - 2y) \quad \text{Substitute 6 - 2x for y.} \]
\[ 3x = 31 + 24 - 8x \quad \text{Distributive Property} \]
\[ 11x = 55 \quad \text{Add 8x to each side.} \]
\[ x = 5 \quad \text{Divide each side by 11.} \]

To find the value for \( y \), substitute 5 for \( x \) in either equation.

\[ y = 6 - 2x \quad \text{First equation} \]
\[ y = 6 - 2(5) \quad \text{Substitute 5 for x.} \]
\[ y = -4 \quad \text{Simplify.} \]

The solution is \((5, -4)\).

Organizing Data

You can use a computer spreadsheet to organize and display data. Then you can use the data to create graphs or perform calculations.

Example

Enter the data on the Atlantic Coast Conference Men’s Basketball scoring into a spreadsheet.

Use Column A for the team names, Column B for the numbers of free throws, Column C for the numbers of 2-point field goals, and Column D for the numbers of 3-point field goals.

Model and Analyze

1. Enter the data about sports-utility vehicles on page 154 into a spreadsheet.
2. Compare and contrast how data are organized in a spreadsheet and how they are organized in a matrix.
In her job as a hospital dietician, Celeste designs weekly menus for her patients and tracks various nutrients for each daily diet. The table shows the Calories, protein, and fat in a patient’s meals over a three-day period.

<table>
<thead>
<tr>
<th>Day</th>
<th>Breakfast</th>
<th>Lunch</th>
<th>Dinner</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Calories</td>
<td>Protein (g)</td>
<td>Fat (g)</td>
</tr>
<tr>

</tr>
<tr>
<td>2</td>
<td>482</td>
<td>12</td>
<td>17</td>
</tr>
<tr>
<td>3</td>
<td>530</td>
<td>10</td>
<td>11</td>
</tr>
</tbody>
</table>

These data can be organized in three matrices representing breakfast, lunch, and dinner. The daily totals can then be found by adding the three matrices.

**ADD AND SUBTRACT MATRICES** Matrices can be added if and only if they have the same dimensions.

### Example 1: Add Matrices

**a.** Find \( A + B \) if \( A = \begin{bmatrix} 4 & -6 \\ 2 & 3 \end{bmatrix} \) and \( B = \begin{bmatrix} -3 & 7 \\ 5 & -9 \end{bmatrix} \).

\[
A + B = \begin{bmatrix} 4 & -6 \\ 2 & 3 \end{bmatrix} + \begin{bmatrix} -3 & 7 \\ 5 & -9 \end{bmatrix} = \begin{bmatrix} 4 + (-3) & -6 + 7 \\ 2 + 5 & 3 + (-9) \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 7 & -6 \end{bmatrix}
\]

**b.** Find \( A + B \) if \( A = \begin{bmatrix} 3 & -7 \\ 12 & 5 \end{bmatrix} \) and \( B = \begin{bmatrix} 2 & 9 \\ 4 & -6 \end{bmatrix} \).

Since the dimensions of \( A \) are \( 2 \times 3 \) and the dimensions of \( B \) are \( 2 \times 2 \), you cannot add these matrices.
You can subtract matrices in a similar manner.

**Key Concept**

$= \begin{bmatrix} 6 & -4 \\ -12 & 9 \end{bmatrix}$ Simplify.

**Example 3**

**Use Matrices to Model Real-World Data**

**ANIMALS** The table below shows the number of endangered and threatened species in the United States and in the world. How many more endangered and threatened species are there on the world list than on the U.S. list?

The matrix $\begin{bmatrix} 2 & 4 & 6 \\ 7 & 8 & 9 \end{bmatrix}$ is called a **zero matrix**. It is the additive identity matrix for any $2 \times 2$ matrix. How is this similar to the additive identity for real numbers?

### SCALAR MULTIPLICATION

You can multiply any matrix by a constant called a **scalar**. This operation is called **scalar multiplication**.

**Key Concept**

**Scalar Multiplication**

- **Words**: The product of a scalar $k$ and an $m \times n$ matrix is an $m \times n$ matrix in which each element equals $k$ times the corresponding elements of the original matrix.

- **Symbols**: $k \begin{bmatrix} a & b & c \\ d & e & f \end{bmatrix} = \begin{bmatrix} ka & kb & kc \\ kd & ke & kf \end{bmatrix}$

**Example 4**

**Multiply a Matrix by a Scalar**

If $A = \begin{bmatrix} 2 & 8 \\ 5 & -9 \end{bmatrix}$, find $3A$.

$3A = 3 \begin{bmatrix} 2 & 8 \\ 5 & -9 \end{bmatrix} = \begin{bmatrix} 6 & 24 \\ 15 & -27 \end{bmatrix}$

**Study Tip**

Many properties of real numbers also hold true for matrices.
The order of operations for matrices is similar to that of real numbers. Perform scalar multiplication before matrix addition and subtraction.

**Study Tip**

Matrix Operations

The order of operations for matrices is similar to that of real numbers. Perform scalar multiplication before matrix addition and subtraction.

**Combination of Matrix Operations**

If \( A = \begin{bmatrix} 7 & 3 \\ -4 & -1 \end{bmatrix} \) and \( B = \begin{bmatrix} 9 & 6 \\ 3 & 10 \end{bmatrix} \), find \( 5A - 2B \).

Perform the scalar multiplication first. Then subtract the matrices.

\[
5A - 2B = \begin{bmatrix} 7 & 3 \\ -4 & -1 \end{bmatrix} - 2 \begin{bmatrix} 9 & 6 \\ 3 & 10 \end{bmatrix} = \begin{bmatrix} 5(7) & 5(3) \\ 5(-4) & 5(-1) \end{bmatrix} - \begin{bmatrix} 2(9) & 2(6) \\ 2(3) & 2(10) \end{bmatrix} = \begin{bmatrix} 35 & 15 \\ -20 & -5 \end{bmatrix} - \begin{bmatrix} 18 & 12 \\ 6 & 20 \end{bmatrix} = \begin{bmatrix} 35 - 18 & 15 - 12 \\ -20 - 6 & -5 - 20 \end{bmatrix} = \begin{bmatrix} 17 & 3 \\ -26 & -25 \end{bmatrix}
\]

**Graphing Calculator Investigation**

**Matrix Operations**

Most graphing calculators can perform operations with matrices. On the TI-83 Plus, \( \text{2nd} \) [MATRIX] accesses the matrix menu. Choose EDIT to define a matrix. Enter the dimensions of the matrix \( A \) using the [ ] key. Then enter each element by pressing \( \text{ENTER} \) after each entry. To display and use the matrix in calculations, choose the matrix under NAMES from the [MATRIX] menu.

**Think and Discuss**

1. Enter \( A = \begin{bmatrix} 3 & -2 \\ 5 & 4 \end{bmatrix} \) with a graphing calculator. Does the calculator enter elements row by row or column by column?
2. Notice that there are two numbers in the bottom left corner of the screen. What do these numbers represent?
3. Clear the screen. Find the matrix \( 18A \).
4. Enter \( B = \begin{bmatrix} 1 & 9 \\ 8 & 6 \\ -3 & -5 \end{bmatrix} \). Find \( A + B \). What is the result and why?

**Check for Understanding**

**Concept Check**

1. Describe the conditions under which matrices can be added or subtracted.
2. \( \text{OPEN ENDED} \) Give an example of two matrices whose sum is a zero matrix.
3. Write a matrix that, when added to a \( 3 \times 2 \) matrix, increases each element in the matrix by 4.

**Guided Practice**

Perform the indicated matrix operations. If the matrix does not exist, write impossible.

4. \( \begin{bmatrix} 5 & 8 & -4 \\ -2 & 1 \end{bmatrix} + \begin{bmatrix} 12 & 5 \\ 6 & 7 \end{bmatrix} \)

5. \( \begin{bmatrix} 3 & 7 \\ -2 & 1 \end{bmatrix} - \begin{bmatrix} 2 & -3 \\ 5 & -4 \end{bmatrix} \)

6. \( \begin{bmatrix} 6 & -1 \\ 7 & 3 \\ -2 & 8 \end{bmatrix} \)

7. \( \begin{bmatrix} 2 & 7 \\ -3 & 6 \end{bmatrix} + \begin{bmatrix} -6 & -4 \\ 3 & 0 \end{bmatrix} \)
Use matrices $A$, $B$, and $C$ to find the following.

$$
A = \begin{bmatrix} 2 & 3 \\ 5 & 6 \end{bmatrix} \quad B = \begin{bmatrix} -1 & 7 \\ 0 & -4 \end{bmatrix} \quad C = \begin{bmatrix} 9 & -4 \\ -6 & 5 \end{bmatrix}
$$

8. $A + B + C$
9. $3B - 2C$
10. $4A + 2B - C$

MULTIPLY MATRICES

You can multiply two matrices if and only if the number of columns in the first matrix is equal to the number of rows in the second matrix. When you multiply two matrices $A_{m \times n}$ and $B_{n \times r}$, the resulting matrix $AB$ is an $m \times r$ matrix.

Outer dimensions = dimensions of $AB$

$A \cdot B = AB$

$2 \times 3 \quad 3 \times 4$

$\uparrow$

Inner dimensions are equal

Example 1

Dimensions of Matrix Products

Determine whether each matrix product is defined. If so, state the dimensions of the product.

a. $A_{2 \times 5}$ and $B_{5 \times 4}$

$A \cdot B = AB$

$2 \times 5 \quad 5 \times 4 \quad 2 \times 4$

The inner dimensions are equal so the matrix product is defined. The dimensions of the product are $2 \times 4$.

b. $A_{1 \times 3}$ and $B_{4 \times 3}$

$A \cdot B$

$1 \times 3 \quad 4 \times 3$

The inner dimensions are not equal, so the matrix product is not defined.
The product of two matrices is found by multiplying columns and rows. The entry in the first row and first column of \( AB \) is found by multiplying corresponding elements in the first row of \( A \) and the first column of \( B \) and then adding.

The element \( a_{ij} \) of \( AB \) is the sum of the products of the corresponding elements in row \( i \) of \( A \) and column \( j \) of \( B \).

\[
\begin{bmatrix}
    a_1 & b_1 \\
    a_2 & b_2
\end{bmatrix}
\begin{bmatrix}
    x_1 & y_1 \\
    x_2 & y_2
\end{bmatrix}
= \begin{bmatrix}
    a_1x_1 + b_1x_2 & a_1y_1 + b_1y_2 \\
    a_2x_1 + b_2x_2 & a_2y_1 + b_2y_2
\end{bmatrix}
\]

**Example 2** Multiply Square Matrices

Find \( RS \) if \( R = \begin{bmatrix} 2 & -1 \\ 3 & 4 \end{bmatrix} \) and \( S = \begin{bmatrix} 3 & -9 \\ 5 & 7 \end{bmatrix} \).

\[
RS = \begin{bmatrix} 2 & -1 \\ 3 & 4 \end{bmatrix} \cdot \begin{bmatrix} 3 & -9 \\ 5 & 7 \end{bmatrix}
\]

**Step 1** Multiply the numbers in the first row of \( R \) by the numbers in the first column of \( S \), add the products, and put the result in the first row, first column of \( RS \).

\[
\begin{bmatrix} 2 & -1 \\ 3 & 4 \end{bmatrix} \cdot \begin{bmatrix} 3 \\ 5 \end{bmatrix} = \begin{bmatrix} 2(3) + (-1)(5) \\ 3(3) + 4(5) \end{bmatrix} = \begin{bmatrix} 1 \\ 29 \end{bmatrix}
\]

**Step 2** Multiply the numbers in the first row of \( R \) by the numbers in the second column of \( S \), add the products, and put the result in the first row, second column of \( RS \).

\[
\begin{bmatrix} 2 & -1 \\ 3 & 4 \end{bmatrix} \cdot \begin{bmatrix} -9 \\ 7 \end{bmatrix} = \begin{bmatrix} 2(3) + (-1)(-9) \\ 3(3) + 4(7) \end{bmatrix} = \begin{bmatrix} 25 \\ 3(3) + 4(7) \end{bmatrix} = \begin{bmatrix} 25 \\ 3(-9) + 4(7) \end{bmatrix}
\]

**Step 3** Multiply the numbers in the second row of \( R \) by the numbers in the first column of \( S \), add the products, and put the result in the second row, first column of \( RS \).

\[
\begin{bmatrix} 2 & -1 \\ 3 & 4 \end{bmatrix} \cdot \begin{bmatrix} 3 \\ 5 \end{bmatrix} = \begin{bmatrix} 2(3) + (-1)(5) \\ 3(3) + 4(5) \end{bmatrix} = \begin{bmatrix} 1 \\ 29 \end{bmatrix}
\]

**Step 4** Multiply the numbers in the second row of \( R \) by the numbers in the second column of \( S \), add the products, and put the result in the second row, second column of \( RS \).

\[
\begin{bmatrix} 2 & -1 \\ 3 & 4 \end{bmatrix} \cdot \begin{bmatrix} -9 \\ 7 \end{bmatrix} = \begin{bmatrix} 2(3) + (-1)(-9) \\ 3(3) + 4(7) \end{bmatrix} = \begin{bmatrix} 25 \\ 3(-9) + 4(7) \end{bmatrix}
\]

**Step 5** Simplify the product matrix.

\[
\begin{bmatrix} 25 \\ 29 \end{bmatrix} = \begin{bmatrix} 1 \\ 29 \end{bmatrix}
\]

So, \( RS = \begin{bmatrix} 1 & -25 \\ 29 & 1 \end{bmatrix} \).

When solving real-world problems, make sure to multiply the matrices in the order for which the product is defined.
In a four-team track meet, 5 points were awarded for each first-place finish, 3 points for each second, and 1 point for each third. Find the total number of points for each school. Which school won the meet?

Explore

The final scores can be found by multiplying the track results for each school by the points awarded for each first-, second-, and third-place finish.

5 & 7 & 3 \\
7 & 5 & 4

5(5) + 7(3) + 3(1) \\
7(5) + 5(3) + 4(1)
\end{bmatrix}
\]

Multiply columns by rows.

\[
= \begin{bmatrix}
57 \\
46 \\
49 \\
54
\end{bmatrix}
\]

Simplify.

The labels for the product matrix are shown below.

**Total Points**

Jefferson 57

Springfield 49
Madison 54

Jefferson won the track meet with a total of 57 points.

Examine

\( R \) is a \( 4 \times 3 \) matrix and \( P \) is a \( 3 \times 1 \) matrix; so their product should be a \( 4 \times 1 \) matrix. Why?

MULTIPLICATIVE PROPERTIES

Recall that the same properties for real numbers also held true for matrix addition. However, some of these properties do not always hold true for matrix multiplication.
Example 4  **Commutative Property**

Find each product if \( P = \begin{bmatrix} 8 & -7 \\ -2 & 4 \\ 0 & 3 \end{bmatrix} \) and \( Q = \begin{bmatrix} 9 & -3 & 2 \\ 6 & -1 & -5 \end{bmatrix} \).

a. \( PQ \)

\[
PQ = \begin{bmatrix} 8 & -7 \\ -2 & 4 \\ 0 & 3 \end{bmatrix} \cdot \begin{bmatrix} 9 & -3 & 2 \\ 6 & -1 & -5 \end{bmatrix}
\]

\[
= \begin{bmatrix} 72 - 42 & -24 + 7 & 16 + 35 \\ -18 + 24 & 6 - 4 & -4 - 20 \\ 0 + 18 & 0 - 3 & 0 - 15 \end{bmatrix}
\]

\[
= \begin{bmatrix} 30 - 17 & 51 \\ 6 & -24 \\ 18 & -15 \end{bmatrix}
\]

b. \( QP \)

\[
QP = \begin{bmatrix} 9 & -3 & 2 \\ 6 & -1 & -5 \end{bmatrix} \cdot \begin{bmatrix} 8 & -7 \\ -2 & 4 \\ 0 & 3 \end{bmatrix}
\]

\[
= \begin{bmatrix} 72 + 6 + 0 & -63 - 12 + 6 \\ 48 + 2 + 0 & -42 - 4 - 15 \end{bmatrix}
\]

\[
= \begin{bmatrix} 78 & -69 \\ 50 & -61 \end{bmatrix}
\]

In Example 4, notice that \( PQ \neq QP \) because \( \begin{bmatrix} 30 & -17 & 51 \\ 6 & 2 & -24 \\ 18 & -3 & -15 \end{bmatrix} \neq \begin{bmatrix} 78 & -69 \\ 50 & -61 \end{bmatrix} \).

This demonstrates that the Commutative Property of Multiplication does not hold for matrix multiplication. The order in which you multiply matrices is very important.

Example 5  **Distributive Property**

Find each product if \( A = \begin{bmatrix} 3 & 2 \\ -1 & 4 \end{bmatrix} \), \( B = \begin{bmatrix} -2 & 5 \\ 6 & 7 \end{bmatrix} \), and \( C = \begin{bmatrix} 1 & 1 \\ -5 & 3 \end{bmatrix} \).

a. \( A(B + C) \)

\[
A(B + C) = \begin{bmatrix} 3 & 2 \\ -1 & 4 \end{bmatrix} \cdot \left[ \begin{bmatrix} -2 & 5 \\ 6 & 7 \end{bmatrix} + \begin{bmatrix} 1 & 1 \\ -5 & 3 \end{bmatrix} \right]
\]

\[
= \begin{bmatrix} 3 & 2 \\ -1 & 4 \end{bmatrix} \cdot \begin{bmatrix} -1 & 6 \\ 1 & 10 \end{bmatrix}
\]

\[
= \begin{bmatrix} 3(-1) + 2(1) & 3(6) + 2(10) \\ -1(-1) + 4(1) & -1(6) + 4(10) \end{bmatrix}
\]

or \( \begin{bmatrix} -1 & 38 \\ 5 & 34 \end{bmatrix} \)

b. \( AB + AC \)

\[
AB + AC = \begin{bmatrix} 3 & 2 \\ -1 & 4 \end{bmatrix} \cdot \begin{bmatrix} -2 & 5 \\ 6 & 7 \end{bmatrix} + \begin{bmatrix} 3 & 2 \\ -1 & 4 \end{bmatrix} \cdot \begin{bmatrix} 1 & 1 \\ -5 & 3 \end{bmatrix}
\]

\[
= \begin{bmatrix} 3(-2) + 2(6) & 3(5) + 2(7) \\ -1(-2) + 4(6) & -1(5) + 4(7) \end{bmatrix} + \begin{bmatrix} 3(1) + 2(-5) & 3(1) + 2(3) \\ -1(1) + 4(-5) & -1(1) + 4(3) \end{bmatrix}
\]

\[
= \begin{bmatrix} 6 & 29 \\ 26 & 23 \end{bmatrix} + \begin{bmatrix} -7 & 9 \\ -21 & 11 \end{bmatrix}
\]

\[
= \begin{bmatrix} -1 & 38 \\ 5 & 34 \end{bmatrix}
\]
Notice that in Example 5, $A(B + C) = AB + AC$. This and other examples suggest that the Distributive Property is true for matrix multiplication. Some properties of matrix multiplication are shown below.

### Concept Summary: Properties of Matrix Multiplication

For any matrices $A$, $B$, and $C$ for which the matrix product is defined, and any scalar $c$, the following properties are true.

- **Associative Property of Matrix Multiplication**: $(AB)C = A(BC)$
- **Associative Property of Scalar Multiplication**: $c(AB) = (cA)B = A(cB)$
- **Left Distributive Property**: $C(A + B) = CA + CB$
- **Right Distributive Property**: $(A + B)C = AC + BC$

To show that a property is true for all cases, you must show it is true for the general case. To show that a property is **not** true for all cases, you only need to find a counterexample.

4-4 Transformations with Matrices

What You’ll Learn

• Use matrices to determine the coordinates of a translated or dilated figure.
• Use matrix multiplication to find the coordinates of a reflected or rotated figure.

How are transformations used in computer animation?

Computer animation creates the illusion of motion by using a succession of computer-generated still images. Computer animation is used to create movie special effects and to simulate images that would be impossible to show otherwise. An object’s size and orientation are stored in a computer program. Complex geometric figures can be broken into simple triangles and then moved to other parts of the screen.

Transformations are functions that map points of a preimage onto its image. If the image and preimage are congruent figures, the transformation is an isometry.

One type of isometry is a translation. A translation occurs when a figure is moved from one location to another without changing its size, shape, or orientation. You can use matrix addition and a translation matrix to find the coordinates of a translated figure.

Example 1 Translate a Figure

Find the coordinates of the vertices of the image of quadrilateral QUAD with \(Q(2, 3), U(5, 2), A(4, -2),\) and \(D(1, -1),\) if it is moved 4 units to the left and 2 units up. Then graph QUAD and its image \(Q’U’A’D’.\)

Write the vertex matrix for quadrilateral QUAD.

\[
\begin{bmatrix}
2 & 5 & 4 & 1 \\
3 & 2 & -2 & -1
\end{bmatrix}
\]

To translate the quadrilateral 4 units to the left, add \(-4\) to each \(x\)-coordinate. To translate the figure 2 units up, add 2 to each \(y\)-coordinate. This can be done by adding the translation matrix \[
\begin{bmatrix}
-4 & -4 & -4 & -4 \\
2 & 2 & 2 & 2
\end{bmatrix}
\]
to the vertex matrix of QUAD.
### Example 2 Find a Translation Matrix

**Short-Response Test Item**

Rectangle $A'B'C'D'$ is the result of a translation of rectangle $ABCD$. A table of the vertices of each rectangle is shown. Find the coordinates of $A$ and $D'$.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Rectangle</strong></td>
<td><strong>Rectangle</strong></td>
</tr>
<tr>
<td>$ABCD$</td>
<td>$A'B'C'D'$</td>
</tr>
<tr>
<td>$A$</td>
<td>$A'(-1, 1)$</td>
</tr>
<tr>
<td>$B(1, 5)$</td>
<td>$B'(4, 1)$</td>
</tr>
<tr>
<td>$C(1, -2)$</td>
<td>$C'(4, -6)$</td>
</tr>
<tr>
<td>$D(-4, -2)$</td>
<td>$D'$</td>
</tr>
</tbody>
</table>

**Read the Test Item**

- You are given the coordinates of the preimage and image of points $B$ and $C$. Use this information to find the translation matrix. Then you can use the translation matrix to find the coordinates of $A$ and $D'$.

**Solve the Test Item**

- Write a matrix equation. Let $(a, b)$ represent the coordinates of $A$ and let $(c, d)$ represent the coordinates of $D'$.

  \[
  \begin{bmatrix} a & 1 & 1 & -4 \\ b & 5 & -2 & -2 \end{bmatrix} + \begin{bmatrix} x & x & x & x \\ y & y & y & y \end{bmatrix} = \begin{bmatrix} -1 & 4 & 4 & c \\ 1 & 1 & -6 & d \end{bmatrix}\\
  \begin{bmatrix} a + x & 1 + x & 1 + x & -4 + x \\ b + y & 5 + y & -2 + y & -2 + y \end{bmatrix} = \begin{bmatrix} -1 & 4 & 4 & c \\ 1 & 1 & -6 & d \end{bmatrix}
  \]

- Since these two matrices are equal, corresponding elements are equal.

  **Solve an equation for $x$.**

  \[
  1 + x = 4 \\
  x = 3
  \]

  **Solve an equation for $y$.**

  \[
  5 + y = 1 \\
  y = -4
  \]

- Use the values for $x$ and $y$ to find the values for $A(a, b)$ and $D'(c, d)$.

  \[
  \begin{align*}
  a + x &= -1 \\
  a + 3 &= -1 \\
  a &= -4 \\
  b + y &= 1 \\
  b + (-4) &= 1 \\
  b &= 5
  \end{align*}\\
  \begin{align*}
  -4 + x &= c \\
  -4 + 3 &= c \\
  -1 &= c \\
  -2 + y &= d \\
  -2 + (-4) &= d \\
  -6 &= d
  \end{align*}
  \]

So the coordinates of $A$ are $(-4, 5)$, and the coordinates for $D'$ are $(-1, -6)$.

---

When a geometric figure is enlarged or reduced, the transformation is called a **dilation**. In a dilation, all linear measures of the image change in the same ratio. For example, if the length of each side of a figure doubles, then the perimeter doubles, and vice versa. You can use scalar multiplication to perform dilations.
Reflection Matrices

For a reflection over the:

- **x-axis**
- **y-axis**
- line $y = x$

<table>
<thead>
<tr>
<th>Multiply the vertex matrix on the left by:</th>
<th>$x$-axis</th>
<th>$y$-axis</th>
<th>line $y = x$</th>
</tr>
</thead>
<tbody>
<tr>

<td>$[1, 0]$</td>
<td>$[0, 1]$</td>
<td></td>
</tr>
<tr>
<td>$[0, -1]$</td>
<td>$[-1, 0]$</td>
<td>$[0, 1]$</td>
<td></td>
</tr>
</tbody>
</table>

**Example 3**

**Dilation**

$\triangle JKL$ has vertices $J(-2, -3), K(-5, 4),$ and $L(3, 2).$ Dilate $\triangle JKL$ so that its perimeter is one-half the original perimeter. What are the coordinates of the vertices of $\triangle J'K'L'$?

If the perimeter of a figure is one-half the original perimeter, then the lengths of the sides of the figure will be one-half the measure of the original lengths. Multiply the vertex matrix by the scale factor of $\frac{1}{2}$.

$$\begin{bmatrix} 1 & -2 & -5 & 3 \\ 2 & -3 & 4 & 2 \end{bmatrix} \begin{bmatrix} -1 & -5 & 3 \\ 2 & 2 \end{bmatrix} = \begin{bmatrix} -1 & -5 & 3 \\ 2 & 2 \end{bmatrix}$$

The coordinates of the vertices of $\triangle J'K'L'$ are $J'(-1, -\frac{3}{2}), K'(-\frac{5}{2}, 2),$ and $L'(\frac{3}{2}, 1)$.

Graph $\triangle JKL$ and $\triangle J'K'L'$. The triangles are not congruent. The image has sides that are half the length of those of the original figure.

**REFLECTIONS AND ROTATIONS** In addition to translations, reflections and rotations are also isometries. A reflection occurs when every point of a figure is mapped to a corresponding image across a line of symmetry using a reflection matrix. The matrices used for three common reflections are shown below.

**Example 4**

**Reflection**

Find the coordinates of the vertices of the image of pentagon $QRSTU$ with $Q(1, 3), R(3, 2), S(3, -1), T(1, -2),$ and $U(-1, 1)$ after a reflection across the $y$-axis.

Write the ordered pairs as a vertex matrix. Then multiply the vertex matrix by the reflection matrix for the $y$-axis.

$$\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 3 & 3 & 1 & -1 \\ 3 & 2 & -1 & -2 & 1 \end{bmatrix} = \begin{bmatrix} -1 & -3 & -3 & -1 & 1 \\ 3 & 2 & -1 & -2 & 1 \end{bmatrix}$$

The coordinates of the vertices of $Q'R'S'T'U'$ are $Q'(1, 3), R'(-3, 2), S'(-3, -1), T'(-1, -2),$ and $U'(1, 1).$ Notice that the preimage and image are congruent. Both figures have the same size and shape.
A rotation occurs when a figure is moved around a center point, usually the origin. To determine the vertices of a figure’s image by rotation, multiply its vertex matrix by a rotation matrix. Commonly used rotation matrices are summarized below.

<table>
<thead>
<tr>
<th>Rotation Matrices</th>
<th>90°</th>
<th>180°</th>
<th>270°</th>
</tr>
</thead>
</table>
| Multiply the vertex matrix on the left by: | \[
\begin{bmatrix}
0 & -1 \\
1 & 0
\end{bmatrix}
\] | \[
\begin{bmatrix}
-1 & 0 \\
0 & -1
\end{bmatrix}
\] | \[
\begin{bmatrix}
0 & 1 \\
-1 & 0
\end{bmatrix}
\] |

**Example 5** Rotation

Find the coordinates of the vertices of the image of \( \triangle ABC \) with \( A(4, 3) \), \( B(2, 1) \), and \( C(1, 5) \) after it is rotated 90° counterclockwise about the origin.

Write the ordered pairs in a vertex matrix. Then multiply the vertex matrix by the rotation matrix.

\[
\begin{bmatrix}
0 & -1 \\
1 & 0
\end{bmatrix}
\begin{bmatrix}
4 & 2 & 1 \\
3 & 1 & 5
\end{bmatrix} = \begin{bmatrix}
-3 & -1 & -5 \\
4 & 2 & 1
\end{bmatrix}
\]

The coordinates of the vertices of \( \triangle A'B'C' \) are \( A'(-3, 4) \), \( B'(-1, 2) \), and \( C'(-5, 1) \). The image is congruent to the preimage.

**How are determinants used to find areas of polygons?**

The “Bermuda Triangle” is an area located off the southeastern Atlantic coast of the United States that is noted for a high incidence of unexplained losses of ships, small boats, and aircraft. You can estimate the area of this triangular region by finding the determinant of the matrix that contains the coordinates of the vertices of the triangle.

**DETERMINANTS OF $2 \times 2$ MATRICES**

Every square matrix has a number associated with it called its determinant. A determinant is a square array of numbers or variables enclosed between two parallel lines. For example, the determinant of $\begin{bmatrix} 3 & -1 \\ 2 & 5 \end{bmatrix}$ can be represented by $\begin{vmatrix} 3 & -1 \\ 2 & 5 \end{vmatrix}$ or det $\begin{bmatrix} 3 & -1 \\ 2 & 5 \end{bmatrix}$.

The determinant of a $2 \times 2$ matrix is called a **second-order determinant**.

**Key Concept**

**Second-Order Determinant**

- **Words** The value of a second-order determinant is found by calculating the difference of the products of the two diagonals.

Expansion by Minors

Evaluate \[ \begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} \]
using expansion by minors.

Decide which row of elements to use for the expansion. For this example, we will use the first row.

\[ \begin{vmatrix} 2 & 7 & -3 \\ -1 & 5 & -4 \\ 6 & 9 & 0 \end{vmatrix} = 2 \begin{vmatrix} 5 & -4 \\ 6 & 0 \end{vmatrix} - (-3) \begin{vmatrix} -1 & -4 \\ 6 & 0 \end{vmatrix} + c \begin{vmatrix} -1 & 5 \\ 6 & 9 \end{vmatrix} \]

Expansion by minors

Evaluation 2 \times 2 determinants.

Multiply.

Simplify.

Another method for evaluating a third-order determinant is by using diagonals.

Step 1 Begin by writing the first two columns on the right side of the determinant.
Area of a Triangle

The area of a triangle having vertices at 
(a, b), (c, d), and (e, f) is \( A \), where

\[
A = \frac{1}{2} \begin{vmatrix} a & b & 1 \\ c & d & 1 \\ e & f & 1 \end{vmatrix}.
\]

One very useful application of determinants is finding the areas of polygons. The formula below shows how determinants can be used to find the area of a triangle using the coordinates of the vertices.

**Example 3** Use Diagonals

Evaluate \[
\begin{vmatrix} -1 & 3 & -3 \\ 4 & -2 & -1 \\ 0 & -5 & 2 \end{vmatrix}
\]
using diagonals.

**Step 1** Rewrite the first two columns to the right of the determinant.

\[
\begin{vmatrix} -1 & 3 & -3 \\ 4 & -2 & -1 \\ 0 & -5 & 2 \end{vmatrix}
\]

**Step 2** Find the products of the elements of the diagonals.

\[
\begin{vmatrix} -1 & 3 & -3 \\ 4 & -2 & -1 \\ 0 & -5 & 2 \end{vmatrix}
\]

**Step 3** Add the bottom products and subtract the top products.

\[4 + 0 + 60 - 0 - (-5) - 24 = 45\]

The value of the determinant is 45.
Guided Practice

Find the area of a triangle whose vertices are located at \((-1, 6), (2, 4), \) and \((0, 0)\).

Assign values to \(a, b, c, d, e, \) and \(f\) and substitute them into the Area Formula. Then evaluate.

\[
A = \frac{1}{2} \begin{vmatrix} a & b & 1 \\ c & d & 1 \\ e & f & 1 \end{vmatrix} \quad \text{Area Formula}
\]

\[
= \frac{1}{2} \begin{vmatrix} -1 & 6 & 1 \\ 2 & 4 & 1 \\ 0 & 0 & 1 \end{vmatrix} \quad (a, b) = (-1, 6), (c, d) = (2, 4), (e, f) = (0, 0)
\]

\[
= \frac{1}{2} \left[ -1 \begin{vmatrix} 4 & 1 \\ 0 & 1 \end{vmatrix} - 6 \begin{vmatrix} 2 & 1 \\ 0 & 1 \end{vmatrix} + 1 \begin{vmatrix} 2 & 4 \\ 0 & 0 \end{vmatrix} \right] \quad \text{Expansion by minors}
\]

\[
= \frac{1}{2} \left[ -1(4 - 0) - 6(2 - 0) + 1(0 - 0) \right] \quad \text{Evaluate 2 \times 2 determinants.}
\]

\[
= \frac{1}{2} [-4 - 12 + 0] \quad \text{Multiply.}
\]

\[
= \frac{1}{2} [-16] \text{ or } -8 \quad \text{Simplify.}
\]

Remember that the area of a triangle is the absolute value of \(A\). Thus, the area is \(|-8| \text{ or } 8\) square units.

Lesson 4-6
Cramer’s Rule

What You’ll Learn
• Solve systems of two linear equations by using Cramer’s Rule.
• Solve systems of three linear equations by using Cramer’s Rule.

How is Cramer’s Rule used to solve systems of equations?

Two sides of a triangle are contained in lines whose equations are $1.4x + 3.8y = 3.4$ and $2.5x - 1.7y = -10.9$. To find the coordinates of the vertex of the triangle between these two sides, you must solve the system of equations. However, solving this system by using substitution or elimination would require many calculations. Another method for solving systems of equations is Cramer’s Rule.

SYSTEMS OF TWO LINEAR EQUATIONS Cramer’s Rule uses determinants to solve systems of equations. Consider the following system.

\[
\begin{align*}
ax + by &= e \\
 cx + dy &= f
\end{align*}
\]

Solve for $x$ by using elimination.

\[
\begin{align*}
adx + bdy &= de \\
(-b)cx + bdy &= bf \\
adx - bcx &= de - bf \\
(ad - bc)x &= de - bf
\end{align*}
\]

Subtract.

\[
\begin{align*}
(ad - bc)x &= de - bf \\
x &= \frac{de - bf}{ad - bc}
\end{align*}
\]

Notice that $ad - bc$ must not be zero.

Solving for $y$ in the same way produces the following expression.

\[
y = \frac{af - ce}{ad - bc}
\]

So the solution of the system of equations $ax + by = e$ and $cx + dy = f$ is

\[
\left( \frac{de - bf}{ad - bc}, \frac{af - ce}{ad - bc} \right)
\]

Notice that the denominators for each expression are the same. It can be written using a determinant. The numerators can also be written as determinants.

\[
ad - bc = \begin{vmatrix} a & b \\ c & d \end{vmatrix} \quad de - bf = \begin{vmatrix} e & b \\ f & d \end{vmatrix} \quad af - ce = \begin{vmatrix} a & e \\ c & f \end{vmatrix}
\]

Key Concept Cramer’s Rule for Two Variables

The solution of the system of linear equations

\[
\begin{align*}
ax + by &= e \\
 cx + dy &= f
\end{align*}
\]

is $(x, y)$, where

\[
x = \frac{\begin{vmatrix} e & b \\ f & d \end{vmatrix}}{\begin{vmatrix} a & b \\ c & d \end{vmatrix}}, \quad y = \frac{\begin{vmatrix} e & b \\ f & d \end{vmatrix}}{\begin{vmatrix} a & e \\ c & f \end{vmatrix}}, \quad \text{and} \quad \begin{vmatrix} a & b \\ c & d \end{vmatrix} \neq 0.
\]
System of Two Equations

Use Cramer’s Rule to solve the system of equations.

\[ \begin{align*}
5x + 7y &= 13 \\
2x - 5y &= 13
\end{align*} \]

\[ x = \frac{\begin{vmatrix} e & b \\ f & d \end{vmatrix}}{\begin{vmatrix} a & e \\ c & f \end{vmatrix}} \quad \text{Cramer’s Rule} \quad y = \frac{\begin{vmatrix} a & b \\ c & d \end{vmatrix}}{\begin{vmatrix} a & e \\ c & f \end{vmatrix}} \]

\[ \begin{vmatrix} 13 & 7 \\ 13 & -5 \end{vmatrix} = \frac{\begin{vmatrix} 5 & 13 \\ 5 & 7 \end{vmatrix}}{\begin{vmatrix} 5 & 7 \\ 2 & -5 \end{vmatrix}} \]

\[ \frac{13(-5) - 13(7)}{5(-5) - 2(7)} \quad \text{Evaluate each determinant.} \quad \frac{5(13) - 2(13)}{5(-5) - 2(7)} \]

\[ = \frac{-156}{-39} \quad \text{Simplify.} \quad = \frac{39}{-39} \quad \text{or} \quad -1 \]

The solution is \((4, -1)\).

Cramer’s Rule is especially useful when the coefficients are large or involve fractions or decimals.

Example 2 Use Cramer’s Rule

ELECTIONS In the 2000 presidential election, George W. Bush received about 8,400,000 votes in California and Texas while Al Gore received about 8,300,000 votes in those states. The graph shows the percent of the popular vote that each candidate received in those states.

a. Write a system of equations that represents the total number of votes cast for each candidate in these two states.

Let \(x\) represent the total number of votes in California.

Let \(y\) represent the total number of votes in Texas.

\[ \begin{align*}
0.42x + 0.59y &= 8,400,000 \quad \text{Votes for Bush} \\
0.53x + 0.38y &= 8,300,000 \quad \text{Votes for Gore}
\end{align*} \]

b. Find the total number of popular votes cast in California and in Texas.

\[ x = \frac{\begin{vmatrix} e & b \\ f & d \end{vmatrix}}{\begin{vmatrix} a & e \\ c & f \end{vmatrix}} \quad \text{Cramer’s Rule} \quad y = \frac{\begin{vmatrix} a & b \\ c & d \end{vmatrix}}{\begin{vmatrix} a & e \\ c & f \end{vmatrix}} \]

\[ \begin{vmatrix} 8,400,000 & 0.59 \\ 8,300,000 & 0.38 \end{vmatrix} \quad \begin{vmatrix} 0.42 & 8,400,000 \\ 0.53 & 8,300,000 \end{vmatrix} \]

\[ \left[ \begin{array}{cc} 0.42 & 0.59 \\ 0.53 & 0.38 \end{array} \right] \]

\[ \left[ \begin{array}{ccc} 8,400,000 & 0.59 \\ 8,300,000 & 0.38 \end{array} \right] \]

\[ \left[ \begin{array}{ccc} 0.42 & 0.59 \\ 0.53 & 0.38 \end{array} \right] \]

Elections

In 1936, Franklin D. Roosevelt received a record 523 electoral college votes to Alfred M. Landon’s 8 votes. This is the largest electoral college majority.

Source: The Guinness Book of Records
The solution of the system is about (11,136,512.08, 6,309,601.57).
So, there were about 11,100,000 popular votes cast in California and about
6,300,000 popular votes cast in Texas.

**SYSTEMS OF THREE LINEAR EQUATIONS**
You can also use Cramer’s Rule to solve a system of three equations in three variables.

**Key Concept**

Cramer’s Rule for Three Variables

The solution of the system whose equations are

\[
\begin{align*}
ax + by + cz &= j \\
dx + ey + fz &= k \\
gx + hy + iz &= \ell
\end{align*}
\]

is \((x, y, z)\), where

\[
\begin{align*}
x &= \frac{|j b c|}{|a b c|} = \frac{a j c}{a j c} \\
y &= \frac{|k e f|}{|a b c|} = \frac{b k f}{a b c} \\
z &= \frac{|\ell h i|}{|a b c|} = \frac{c \ell i}{a b c}
\end{align*}
\]

and \(|a b c| \neq 0\).

**Example 3**

System of Three Equations

Use Cramer’s Rule to solve the system of equations.

\[
\begin{align*}
3x + y + z &= -1 \\
-6x + 5y + 3z &= -9 \\
9x - 2y - z &= 5
\end{align*}
\]

\[
\begin{align*}
x &= \frac{|-1 1 1|}{|3 -1 1|} = \frac{-1}{3} \\
y &= \frac{|-9 5 3|}{|3 -1 1|} = \frac{-9}{3} \\
z &= \frac{|5 -2 -1|}{|3 -1 1|} = \frac{-2}{9}
\end{align*}
\]

Use a calculator to evaluate each determinant.

\[
\begin{align*}
x &= \frac{-2}{9} \text{ or } \frac{2}{9} \\
y &= \frac{-4}{3} \text{ or } -\frac{4}{3} \\
z &= \frac{3}{9} \text{ or } -\frac{1}{3}

Identity and Inverse Matrices

• Find the inverse of a $2 \times 2$ matrix.

Vocabulary

• identity matrix
• inverse

How are inverse matrices used in cryptography?

With the rise of Internet shopping, ensuring the privacy of the user’s personal information has become an important priority. Companies protect their computers by using codes. Cryptography is a method of preparing coded messages that can only be deciphered by using the “key” to the message.

The following technique is a simplified version of how cryptography works.

• First, assign a number to each letter of the alphabet.
• Convert your message into a matrix and multiply it by the coding matrix. The message is now unreadable to anyone who does not have the key to the code.
• To decode the message, the recipient of the coded message would multiply by the opposite, or inverse, of the coding matrix.

IDENTITY AND INVERSE MATRICES

Recall that in real numbers, two numbers are inverses if their product is the identity, 1. Similarly, for matrices, the identity matrix is a square matrix that, when multiplied by another matrix, equals that same matrix. If $A$ is any $n \times n$ matrix and $I$ is the $n \times n$ identity matrix, then $A \cdot I = A$ and $I \cdot A = A$.

$2 \times 2$ Identity Matrix

\[
\begin{bmatrix}
1 & 0 \\
0 & 1
\end{bmatrix}
\]

$3 \times 3$ Identity Matrix

\[
\begin{bmatrix}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{bmatrix}
\]

Key Concept

Identity Matrix for Multiplication

• Words The identity matrix for multiplication $I$ is a square matrix with 1 for every element of the main diagonal, from upper left to lower right, and 0 in all other positions. For any square matrix $A$ of the same dimension as $I$, $A \cdot I = I \cdot A = A$.

• Symbols If $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$, then $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ such that

\[
\begin{bmatrix} a & b \\ c & d \end{bmatrix} \cdot \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}.
\]

Two $n \times n$ matrices are inverses of each other if their product is the identity matrix. If matrix $A$ has an inverse symbolized by $A^{-1}$, then $A \cdot A^{-1} = A^{-1} \cdot A = I$. 
Verify Inverse Matrices

Determine whether each pair of matrices are inverses.

a. \( X = \begin{bmatrix} 2 & 2 \\ -1 & 4 \end{bmatrix} \) and \( Y = \begin{bmatrix} 1 & 1 \\ 2 & 2 \end{bmatrix} \)

Check to see if \( X \cdot Y = I \).

\[
X \cdot Y = \begin{bmatrix} 2 & 2 \\ -1 & 4 \end{bmatrix} \cdot \begin{bmatrix} 1 & 1 \\ 2 & 2 \end{bmatrix} = \begin{bmatrix} 1 - 2 & 1 + \frac{1}{2} \\ -\frac{1}{2} + (-4) & -\frac{1}{2} + 1 \end{bmatrix}
\]

or

\[
\begin{bmatrix} -1 & \frac{1}{2} \\ -4 & \frac{1}{2} \end{bmatrix}
\]

Matrix multiplication

Since \( X \cdot Y \neq I \), they are not inverses.

b. \( P = \begin{bmatrix} 3 & 4 \\ 1 & 2 \end{bmatrix} \) and \( Q = \begin{bmatrix} -1 & -2 \\ \frac{1}{2} & \frac{3}{2} \end{bmatrix} \)

Find \( P \cdot Q \).

\[
P \cdot Q = \begin{bmatrix} 3 & 4 \\ 1 & 2 \end{bmatrix} \cdot \begin{bmatrix} -1 & -2 \\ \frac{1}{2} & \frac{3}{2} \end{bmatrix} = \begin{bmatrix} 3 - 2 & -6 + 6 \\ 1 - 1 & -2 + 3 \end{bmatrix}
\]

or

\[
\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}
\]

Matrix multiplication

Now find \( Q \cdot P \).

\[
Q \cdot P = \begin{bmatrix} 1 & -2 \\ -\frac{1}{2} & \frac{3}{2} \end{bmatrix} \cdot \begin{bmatrix} 3 & 4 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} 3 - 2 & 4 - 4 \\ -\frac{3}{2} + \frac{3}{2} & -2 + 3 \end{bmatrix}
\]

or

\[
\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}
\]

Matrix multiplication

Since \( P \cdot Q = Q \cdot P = I \), \( P \) and \( Q \) are inverses.

FIND INVERSE MATRICES

Some matrices do not have an inverse. You can determine whether a matrix has an inverse by using the determinant.

Key Concept

Inverse of a 2 \times 2 Matrix

The inverse of matrix \( A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \) is \( A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \) where \( ad - bc \neq 0 \).

Notice that \( ad - bc \) is the value of det \( A \). Therefore, if the value of the determinant of a matrix is 0, the matrix cannot have an inverse.
Lesson 4-7
Identity and Inverse Matrices

Find the Inverse of a Matrix

Find the inverse of each matrix, if it exists.

a. \( R = \begin{bmatrix} -4 & -3 \\ 8 & 6 \end{bmatrix} \)

Find the value of the determinant.
\[
\begin{vmatrix} -4 & -3 \\ 8 & 6 \end{vmatrix} = -24 - (-24) = 0
\]

Since the determinant equals 0, \( R^{-1} \) does not exist.

b. \( P = \begin{bmatrix} 3 & 1 \\ 5 & 2 \end{bmatrix} \)

Find the value of the determinant.
\[
\begin{vmatrix} 3 & 1 \\ 5 & 2 \end{vmatrix} = 6 - 5 = 1
\]

Since the determinant does not equal 0, \( P^{-1} \) exists.

\[
P^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \quad \text{Definition of inverse}
\]
\[
= \frac{1}{3(2) - 1(5)} \begin{bmatrix} 2 & -1 \\ -5 & 3 \end{bmatrix} \quad a = 3, b = 1, c = 5, d = 1
\]
\[
= \frac{1}{1} \begin{bmatrix} 2 & -1 \\ -5 & 3 \end{bmatrix} \quad \text{Simplify.}
\]

**CHECK**
\[
\begin{bmatrix} 2 & -1 \\ -5 & 3 \end{bmatrix} \cdot \begin{bmatrix} 3 & 1 \\ 5 & 2 \end{bmatrix} = \begin{bmatrix} 6 - 5 & 2 - 2 \\ 15 - 15 & -5 + 6 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \checkmark
\]

Cryptography

The Enigma was a German coding machine used in World War II. Its code was considered to be unbreakable. However, the code was eventually solved by a group of Polish mathematicians.

Source: www.bletchleypark.org.uk

Matrices can be used to code messages by placing the message in a \( 2 \times n \) matrix.

Example 3
Use Inverses to Solve a Problem

a. **CRYPTOGRAPHY** Use the table at the beginning of the lesson to assign a number to each letter in the message GO_TONIGHT. Then code the message with the matrix \( A = \begin{bmatrix} 2 & 1 \\ 4 & 3 \end{bmatrix} \).

Convert the message to numbers using the table.

<table>
<thead>
<tr>
<th>G</th>
<th>O</th>
<th>T</th>
<th>O</th>
<th>N</th>
<th>I</th>
<th>G</th>
<th>H</th>
<th>T</th>
</tr>
</thead>
<tbody>

<td>7</td>
<td>15</td>
<td>0</td>
<td>20</td>
<td>15</td>
<td>14</td>
<td>9</td>
<td>7</td>
<td>8</td>
</tr>
</tbody>
</table>

Write the message in matrix form. Then multiply the message matrix \( B \) by the coding matrix \( A \).

\[
BA = \begin{bmatrix} 7 & 15 \\ 0 & 20 \\ 15 & 14 \\ 9 & 7 \\ 8 & 20 \end{bmatrix} \cdot \begin{bmatrix} 2 & 1 \\ 4 & 3 \end{bmatrix} \quad \text{Write an equation.}
\]
\[
\begin{bmatrix} 14 + 60 & 7 + 45 \\ 0 + 80 & 0 + 60 \\ 30 + 56 & 15 + 42 \\ 18 + 28 & 9 + 21 \\ 16 + 80 & 8 + 60 \end{bmatrix} \quad \text{Matrix multiplication}
\]

(continued on the next page)
\[
\begin{bmatrix}
74 & 52 \\
80 & 60 \\
86 & 57 \\
46 & 30 \\
96 & 68 \\
\end{bmatrix}
\]

Simplify.

The coded message is 74 | 52 | 80 | 60 | 86 | 57 | 46 | 30 | 96 | 68.

b. Use the inverse matrix \( A^{-1} \) to decode the message in Example 3a.

First find the inverse matrix of \( A = \begin{bmatrix} 2 & 1 \\ 4 & 3 \end{bmatrix} \).

\[
A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}
\]

Definition of inverse

\[
= \frac{1}{2(3) - (1)(4)} \begin{bmatrix} 3 & -1 \\ -4 & 2 \end{bmatrix}
\]

\( a = 2, \ b = 1, \ c = 4, \ d = 3 \)

\[
= \frac{1}{2} \begin{bmatrix} 3 & -1 \\ -4 & 2 \end{bmatrix} = \begin{bmatrix} 3 & -1 \\ -2 & 1 \end{bmatrix}
\]

Simplify.

Next, decode the message by multiplying the coded matrix \( C \) by \( A^{-1} \).

\[
CA^{-1} = \begin{bmatrix} 74 & 52 \\ 80 & 60 \\ 86 & 57 \\ 46 & 30 \\ 96 & 68 \end{bmatrix} \cdot \begin{bmatrix} 3 & -1 \\ 2 & 1 \end{bmatrix}
\]

\[
= \begin{bmatrix}
111 - 104 & -37 + 52 \\
120 - 120 & -40 + 60 \\
129 - 114 & -43 + 57 \\
69 - 60 & -23 + 30 \\
144 - 136 & -48 + 68 \\
\end{bmatrix}
\]

\[
= \begin{bmatrix}
7 & 15 \\
0 & 20 \\
15 & 14 \\
9 & 7 \\
8 & 20 \\
\end{bmatrix}
\]

Use the table again to convert the numbers to letters. You can now read the message.

How can matrices be used in population ecology?

Population ecology is the study of a species or a group of species that inhabits the same area. A biologist is studying two species of birds that compete for food and territory. He estimates that a particular region with an area of 14.25 acres (approximately 69,000 square yards) can supply 20,000 pounds of food for the birds during their nesting season. Species A needs 140 pounds of food and has a territory of 500 square yards per nesting pair. Species B needs 120 pounds of food and has a territory of 400 square yards per nesting pair. The biologist can use this information to find the number of birds of each species that the area can support.

WRITE MATRIX EQUATIONS The situation above can be represented using a system of equations that can be solved using matrices. Consider the system of equations below. You can write this system with matrices by using the left and right sides of the equations.

\[
\begin{align*}
5x + 7y &= 11 \\
3x + 8y &= 18
\end{align*}
\]

\[
\begin{bmatrix}
5x + 7y \\
3x + 8y
\end{bmatrix} = \begin{bmatrix} 11 \\ 18 \end{bmatrix}
\]

Write the matrix on the left as the product of the coefficients and the variables.

\[
A \cdot X = B
\]

\[
\begin{bmatrix} 5 & 7 \\ 3 & 8 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 11 \\ 18 \end{bmatrix}
\]

The system of equations is now expressed as a matrix equation.

Example 1 Two-Variable Matrix Equation

Write a matrix equation for the system of equations.

\[
\begin{align*}
5x - 6y &= -47 \\
3x + 2y &= -17
\end{align*}
\]

Determine the coefficient, variable, and constant matrices.

\[
\begin{align*}
5x - 6y &= -47 \\
3x + 2y &= -17
\end{align*}
\]

\[
\begin{bmatrix} 5 & -6 \\ 3 & 2 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} -47 \\ -17 \end{bmatrix}
\]

Write the matrix equation.

\[
A \cdot X = B
\]

\[
\begin{bmatrix} 5 & -6 \\ 3 & 2 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} -47 \\ -17 \end{bmatrix}
\]
You can use a matrix equation to determine the weight of an atom of an element.

**Example 2** Solve a Problem Using a Matrix Equation

**Chemistry** The molecular formula for glucose is $C_6H_{12}O_6$, which represents that a molecule of glucose has 6 carbon (C) atoms, 12 hydrogen (H) atoms, and 6 oxygen (O) atoms. One molecule of glucose weighs 180 atomic mass units (amu), and one oxygen atom weighs 16 atomic mass units. The formulas and weights for glucose and another sugar, sucrose, are listed below.

<table>
<thead>
<tr>
<th>Sugar</th>
<th>Formula</th>
<th>Atomic Weight (amu)</th>
</tr>
</thead>
<tbody>
<tr>
<td>glucose</td>
<td>$C_6H_{12}O_6$</td>
<td>180</td>
</tr>
<tr>
<td>sucrose</td>
<td>$C_{12}H_{22}O_{11}$</td>
<td>342</td>
</tr>
</tbody>
</table>

a. **Write a system of equations that represents the weight of each atom.**

Let $c$ represent the weight of a carbon atom.
Let $h$ represent the weight of a hydrogen atom.

Write an equation for the weight of each sugar. The subscript represents how many atoms of each element are in the molecule.

Glucose: $6c + 12h + 6(16) = 180$  
Equation for glucose
$6c + 12h + 96 = 180$  
Simplify.
$6c + 12h = 84$  
Subtract 96 from each side.

Sucrose: $12c + 22h + 11(16) = 342$  
Equation for sucrose
$12c + 22h + 176 = 342$  
Simplify.
$12c + 22h = 166$  
Subtract 176 from each side.

b. **Write a matrix equation for the system of equations.**

Determine the coefficient, variable, and constant matrices.

$6c + 12h = 84$  
$12c + 22h = 166$  
$egin{bmatrix} 6 & 12 \\ 12 & 22 \end{bmatrix} \begin{bmatrix} c \\ h \end{bmatrix} = \begin{bmatrix} 84 \\ 166 \end{bmatrix}$

Write the matrix equation.

$A \cdot X = B$

You will solve this matrix equation in Exercise 11.

**Solve Systems of Equations** You can solve a system of linear equations by solving a matrix equation. A matrix equation in the form $AX = B$, where $A$ is a coefficient matrix, $X$ is a variable matrix, and $B$ is a constant matrix, can be solved in a similar manner as a linear equation of the form $ax = b$.

$$ax = b \quad \text{Write the equation.} \quad AX = B$$

$$\left(\frac{1}{a}\right)ax = \left(\frac{1}{a}\right)b \quad \text{Multiply each side by the inverse of the coefficient, if it exists.} \quad A^{-1}AX = A^{-1}B$$

$$1x = \left(\frac{1}{a}\right)b \quad \left(\frac{1}{a}\right)a = 1, A^{-1}A = I \quad IX = A^{-1}B$$

$$x = \left(\frac{1}{a}\right)b \quad 1x = x, IX = X \quad X = A^{-1}B$$

Notice that the solution of the matrix equation is the product of the inverse of the coefficient matrix and the constant matrix.
To solve a system of equations with three variables, you can use the $3 \times 3$ identity matrix. However, finding the inverse of a $3 \times 3$ matrix may be tedious. Graphing calculators and computer programs offer fast and accurate methods for performing the necessary calculations.

**Example 3** Solve a System of Equations

Use a matrix equation to solve the system of equations.

\[
\begin{align*}
6x + 2y &= 11 \\
3x - 8y &= 1
\end{align*}
\]

The matrix equation is
\[
\begin{bmatrix}
3 & 2 & | & 11 \\
3 & -8 & | & 1
\end{bmatrix}
\]
when
\[
A = \begin{bmatrix}
3 & 2 \\
3 & -8
\end{bmatrix}, \quad X = \begin{bmatrix}
x \\
y
\end{bmatrix}, \quad \text{and } B = \begin{bmatrix}
11 \\
1
\end{bmatrix}.
\]

**Step 1** Find the inverse of the coefficient matrix.

\[
A^{-1} = \frac{1}{-48 - 6} \begin{bmatrix}
-8 & 2 \\
-3 & 6
\end{bmatrix} \quad \text{or} \quad \frac{1}{54} \begin{bmatrix}
-8 & -2 \\
-3 & 6
\end{bmatrix}
\]

**Step 2** Multiply each side of the matrix equation by the inverse matrix.

\[
\begin{bmatrix}
1 & 0 \\
0 & 1
\end{bmatrix} \begin{bmatrix}
x \\
y
\end{bmatrix} = \begin{bmatrix}
5 \\
1
\end{bmatrix}
\]

The solution is $(5, 1)$. Check this solution in the original equation.

**Example 4** System of Equations with No Solution

Use a matrix equation to solve the system of equations.

\[
\begin{align*}
6a - 9b &= -18 \\
8a - 12b &= 24
\end{align*}
\]

The matrix equation is
\[
\begin{bmatrix}
6 & -9 \\
8 & -12
\end{bmatrix} \begin{bmatrix}
a \\
b
\end{bmatrix} = \begin{bmatrix}
-18 \\
24
\end{bmatrix}
\]
and
\[
A = \begin{bmatrix}
6 & -9 \\
8 & -12
\end{bmatrix}, \quad X = \begin{bmatrix}
a \\
b
\end{bmatrix}, \quad \text{and } B = \begin{bmatrix}
-18 \\
24
\end{bmatrix}.
\]

Find the inverse of the coefficient matrix.

\[
A^{-1} = \frac{1}{-72 + 72} \begin{bmatrix}
6 & -9 \\
8 & -12
\end{bmatrix} \quad \text{or} \quad \frac{1}{0} \begin{bmatrix}
6 & -9 \\
8 & -12
\end{bmatrix}
\]

The determinant of the coefficient matrix is 0, so $A^{-1}$ does not exist.

There is no unique solution of this system.

Graph the system of equations. Since the lines are parallel, this system has no solution. Therefore, the system is inconsistent.

### Augmented Matrices

Using a TI-83 Plus, you can solve a system of linear equations using the `MATRX` function. An augmented matrix contains the coefficient matrix with an extra column containing the constant terms. The reduced row echelon function of a graphing calculator reduces the augmented matrix so that the solution of the system of equations can be easily determined.

Write an augmented matrix for the following system of equations. Then solve the system by using the reduced row echelon form on the graphing calculator.

\[ 3x + y + 3z = 2 \]
\[ 2x + y + 2z = 1 \]
\[ 4x + 2y + 5z = 5 \]

**Step 1** Write the augmented matrix and enter it into a calculator.

The augmented matrix \( B = \begin{bmatrix} 3 & 1 & 3 & 2 \\ 2 & 1 & 2 & 1 \\ 4 & 2 & 5 & 5 \end{bmatrix} \).

Begin by entering the matrix.

**KEYSTROKES:** Review matrices on page 163.

**Step 2** Find the reduced row echelon form (rref) using the graphing calculator.

**KEYSTROKES:**

\[
\text{rref } \begin{bmatrix} B \end{bmatrix}
\]  

Study the reduced echelon matrix. The first three columns are the same as a \( 3 \times 3 \) identity matrix. The first row represents \( x = -2 \), the second row represents \( y = -1 \), and the third row represents \( z = 3 \). The solution is \((-2, -1, 3)\).

### Exercises

\[ 2x + y = 1 \]
2. \[ 15x + 11y = 36 \]
\[ 4x - 3y = -26 \]
3. \[ 2x + y = 5 \]
\[ 2x - 3y = 1 \]
4. \[ 3x - y = 0 \]
\[ 2x - 3y = 1 \]
5. \[ 3x - 2y + z = -2 \]
\[ x - y + 3z = 5 \]
\[ -x + y + z = -1 \]
6. \[ x - y + z = 2 \]
\[ x - z = 1 \]
\[ y + 2z = 0 \]

**Lesson-by-Lesson Review**

**4-1 Introduction to Matrices**

**Concept Summary**
- A matrix is a rectangular array of variables or constants in horizontal rows and vertical columns.
- Equal matrices have the same dimensions and corresponding elements equal.

**Example**

Solve \[
\begin{bmatrix}
2x \\
y
\end{bmatrix}
= \begin{bmatrix}
32 + 6y \\
7 - x
\end{bmatrix}
\] for \(x\) and \(y\).

Since the matrices are equal, corresponding elements are equal. You can write two linear equations.

\[
2x = 32 + 6y \\
y = 7 - x
\]

(continued on the next page)
Solve the system of equations.

\[ \begin{align*}
2x &= 32 + 6y \quad \text{First equation} \\
2x &= 32 + 6(7 - x) \quad \text{Substitute } 7 - x \text{ for } y. \\
2x &= 32 + 42 - 6x \quad \text{Distributive Property} \\
8x &= 74 \quad \text{Add } 6x \text{ to each side.} \\
x &= 9.25 \quad \text{Divide each side by } 8.
\end{align*} \]

The solution is \((9.25, -2.25)\).

**Exercises** Solve each equation. See Example 3 on pages 155 and 156.

11. \[ \begin{align*}
2y - x &= 3 \\
x &= \frac{3}{4}y - 1
\end{align*} \]

12. \[ \begin{align*}
7x &= 5 + 2y \\
x + y &= 11
\end{align*} \]

13. \[ \begin{align*}
3x + y &= -3 \\
x - 3y &= -1
\end{align*} \]

14. \[ \begin{align*}
2x - y &= 2 \\
6x - y &= 22
\end{align*} \]

4-8 Using Matrices to Solve Systems of Equations

Concept Summary

• A system of equations can be written as a matrix equation in the form \( A \cdot X = B \).

\[
\begin{align*}
2x + 3y &= 12 \\
x - 4y &= 6
\end{align*}
\]

\[
\rightarrow \begin{bmatrix} 2 & 3 \\ 1 & -4 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 12 \\ 6 \end{bmatrix}
\]

• To solve a matrix equation, find the inverse of the coefficient matrix. Then multiply each side by the inverse matrix, so \( X = A^{-1}B \).

Example

Solve \( \begin{bmatrix} 4 & 8 \\ 2 & -3 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 12 \\ 13 \end{bmatrix} \).

Step 1 Find the inverse of the coefficient matrix.
\[
A^{-1} = \frac{1}{-12 - 16} \begin{bmatrix} -3 & -8 \\ -2 & 4 \end{bmatrix} \text{ or } \frac{1}{-12 - 16} \begin{bmatrix} -3 & -8 \\ -2 & 4 \end{bmatrix}
\]

Step 2 Multiply each side by the inverse matrix.
\[
\frac{1}{-12 - 16} \begin{bmatrix} -3 & -8 \\ -2 & 4 \end{bmatrix} \cdot \begin{bmatrix} 4 & 8 \\ 2 & -3 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \end{bmatrix} = \frac{1}{-12 - 16} \begin{bmatrix} -3 & -8 \\ -2 & 4 \end{bmatrix} \cdot \begin{bmatrix} 12 \\ 13 \end{bmatrix}
\]

\[
\frac{1}{-12 - 16} \begin{bmatrix} -3 & -8 \\ -2 & 4 \end{bmatrix} \cdot \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \frac{1}{-12 - 16} \begin{bmatrix} -3 & -8 \\ -2 & 4 \end{bmatrix} \cdot \begin{bmatrix} 0 \\ 1 \end{bmatrix}
\]

\[
\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 5 \\ -1 \end{bmatrix}
\]

The solution is (5, -1).
